Genotyping Information

Genotyping by end-point PCR based on gel is composed of a genespecific short range PCR using primers on
wild type allele and a mutant allele-specific short range PCR. The combined results show the genotype of the
mice. For example: mutant positive, wild type positive = Heterozygous.

Gel Image

Separated by gel electrophoresis on a 2% agarose gel.

Work as Triplex.

Genotyping using PCR-assays for cassette detection

LacZ reporter, Neo selection cassettes are inserted into the Knockout-first mutant allele. Cassette changes by allele conversion can be found on: http://www.mousephenotype.org/about-ikmc/targeting-strategies. For example, tm1b allele contains still lacZ reporter cassette, Neo selection cassette is deleted (promotor-driven only).

Please note that these assays are with universal cassette primers other than gene-specific. The confirmation on gene identity performed by e.g. sr genespecific PCR as provided is suggested .
