2.2. PCR Protocol.....	7

## 1. Genotyping protocol and data

This section describes the condition used at the Mouse Clinical Institute (ICS) to genotype your **Tgif2** Constitutive Knockout / Conditional Knockout (KO-cKO) project.

### 1.1. Genotyping strategy

The map below describes the position of the primers used for genotyping for each possible allele.

## Sequence of primers used for genotyping:

Position	Primers	Sequence
Ef	5635	CCAAATAGCTCGTTGTTGGC
Er	5640	GCCAGGCTGTCCTGGAAACTTAG
Kr	3210	CCTGTCCCTCTCACCTTCTACC
L3f	5637	GACACAGGAGCAGAGGTTCTGGG
L3f2	5636	GTGAAGTGAGGAGATGACCCAGGG
L3r	5639	CTCCAGCTCGACGGCTAAAAGAC
L3r2	5638	CTCCTCCTCTCCTCTCAGGG
Lxr	3255	ACTGATGGCGAGCTCAGACCATAAC

## PCR fragments expected size (bp):

Region analyzed	Primers used	Position on the primer <i>(see the map above)</i>	Targeted allele (KO allele) (L3)	cKO allele (L2)	KO allele (L-)	WildType allele (WT)
5' part of the selection marker	5635-3210	Ef / Kr	373	---	---	---
Presence of the distal loxP	5637-5639	L3f / L3r	278	278	---	274
Distal loxP specific PCR	5636-3255	L3f2 / Lxr	180	180	---	---
Excision of the selection marker	5635-5640	Ef / Er	5741*	341	---	201
Excision of the floxed exon(s), i.e. knock out	5635-5638	Ef / L3r2	6842*	1442*	332**	1120**

\*: this PCR product will not be observed using our PCR genotyping conditions (see description below)

\*\*: this PCR is only verified if mice are generated

---: no Amplicon should be obtained

## 1.2. PCR protocol

This section describes the composition of the mix and cycling conditions used for genotyping.

Reagents:

- FastStart PCR Master (Roche)
- DNA (50ng/ $\mu$ l)
- 5' primer (100  $\mu$ M)
- 3' primer (100  $\mu$ M)
- Sterile H<sub>2</sub>O

Volume:

- 7.5 $\mu$ l
- 1.5 $\mu$ l
- 0.06 $\mu$ l
- 0.06 $\mu$ l
- up to 15  $\mu$ l

Cycling conditions:

Temp	Time	#Cycles
95°C	4min	1
94°C	30s	
62°C	30s	34
72°C	1min	
72°C	7min	1
20°C	5min	1

**NB: These PCR conditions have been optimized for high-throughput genotyping. Adaptation to small-scale may be required.**

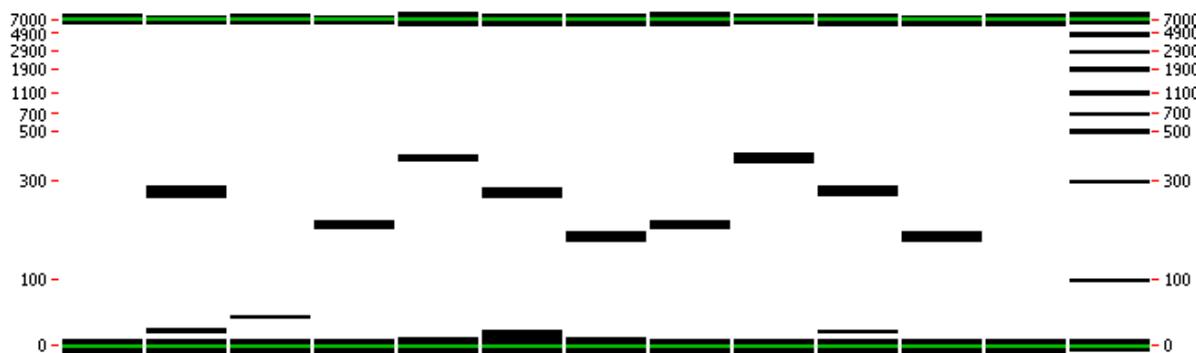

### 1.3. Picture of genotyping with various alleles

Analysis of PCR products pattern was not done by gel electrophoresis but using LabChip® 90 microfluidic apparatus. PCR products were run on the HT DNA 5K LabChip® 90 Assay Kit.

#### Representative genotyping picture

WT/WT	L3/WT	L3/L3
-------	-------	-------

Note that as this technology is more sensitive than gel analysis, non specific signals and/or primer dimers may be visible on the picture.

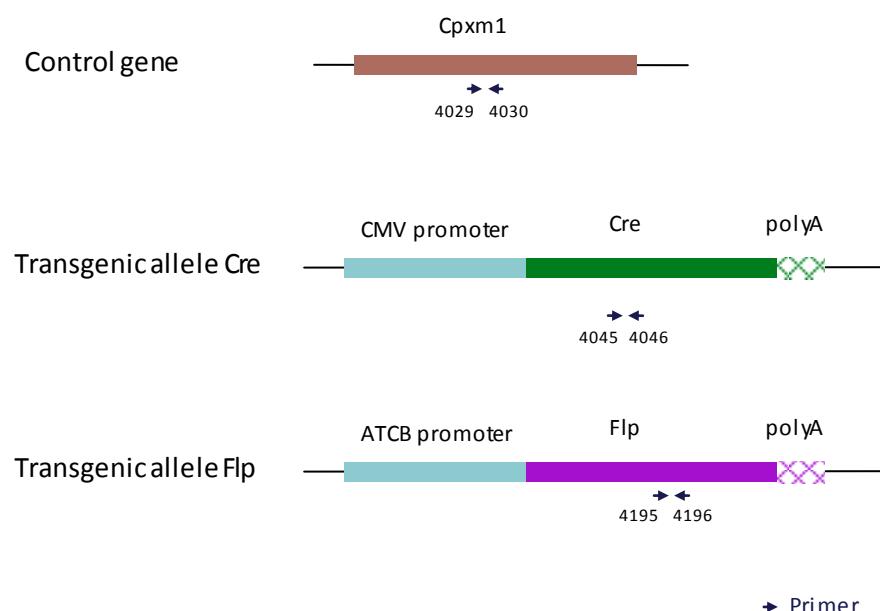

## 2. Cre and Flp genotyping method

The protocol used to segregate the cre and/or flp transgene is indicated below.

Detection of cre transgene and flp transgene is done using a multiplex assay: primer pairs were designed for each gene and for a positive control (Cpxm1 gene).

### 2.1. Cre and Flp genotyping

#### Schematic representation of the genotyping strategy

#### Sequence of primers used for genotyping:

Primers	Sequence
4029	ACTGGGATCTTCGAACCTTTGGAC
4030	GATGTTGGGGCACTGCTCATTCA
4045	CCATCTGCCACCAGCCAG
4046	TCGCCATCTCCAGCAGG
4195	TCTTAGCGCAAGGGGTAGGATCG
4196	GTCCTGGCACGGCAGAAC

#### PCR fragments expected size (bp):

Primer pair	4045-4046	4195-4196	4029-4030
Region analyzed	Middle part of Cre transgene	Middle part of Flp transgene	Cpxm1 control gene
Control gene	/	/	446
Tg allele	281	328	/

## 2.2. PCR Protocol

This section describes the composition of the mix and cycling conditions used for genotyping.

Reagents	Volume
FastStart PCR Master (Roche)	7.5µl
DNA (50ng/µl)	1.5µl
5' primer (100 µM)	0.05µl
3' primer (100 µM)	0.05µl
Sterile H <sub>2</sub> O	up to 15 µl

Cycling conditions are identical to those described in chapter 1.2
