## Genotyping Information

Genotyping by end-point PCR based on gel is composed of a genespecific short range PCR using primers on wild type allele and a mutant allele-specific short range PCR. The combined results show the genotype of the mice. For example: mutant positive, wild type positive = Heterozygous. In addition to the expected product, the mutant assay may also amplify the endogenous wild type sequence, which will appear as a larger band on an agarose gel. The presence of this extra band will depend on the size of the original deletion.

### Amplification conditions

PCR Settings	Temperature (°C)	Time	# of cycles
1 Denaturation (Melting)	95°C	5 min	1
2 Amplification (Melting, Annealing, Polym.)	94°C 68-58 ( $\downarrow 1^{\circ}\text{C/Cycle}$ ) 72°C	30 sec 45 sec 1.5 min	39
3 Polymerisation	72°C	15 min	1
4 Cooling	4°C	hold	1

**Touch-Down cycling protocol:** first 10 cycles anneal at 68°C, decreasing 1°C per cycle, next 30 cycles anneal at 58°C.  
 These PCR conditions have been optimized for our methods and preparation kits. Adoptions may be required.
